

GROUP-14

PROJECT TITLE:

Pinfo

DESCRIPTION:

This application provides a platform that gives access to information which is relevant to your location.

The application is build on the concept of geotagged messages.

This application provide users:

- drop messages for users location.
- share users local events.
- post and reply to local queries.
- seek help from locals.

VISUALS:

1.GPS location permission

For a better experience, turn on device location, which uses Google's location service. ▾

NO THANKS

OK

INSTALLATION:

1.LOAD:

load the project(Pinfo) in android studio.

2.CONFIGURE:

To configure pinfo project, click the link below and specify apps package name when prompted.

SHA-1 hash of users signing certificate is to be provided.

<https://developers.google.com/identity/sign-in/android/start-integrating>.

3.RUN:

Run the application.

USAGE:

If a person wants to know whats happening near him/her or to turn neighbors into a friend,this application server the purpose well as:

- where to get the best coffee?
- which mall to shop?
- whose up for the badminton match?
- need some repairs ,where to go?

Concept:

Geotagging:

-This app is using geotagging to track the location of the users.

-This allows users to augument their post and updates with their current location such that the users only in that vicinity can communicate.

WORKING:

step1: When the application is launched, a splash screen showing the icon of the applications appears.
Along with this a dialog for GPS and location permission will appear.

step2: After few seconds, the google sign-in page appears if you are logging in for the first time

step3: After authenticating google sign-in, you will be redirected to a page containing posts of your location.

step4: On selecting a post, users can interact with the contents of that post, that is any user in the vicinity where a query is posted can reply.

step5: On clicking the profile image icon on the top right of the screen, you will be redirected to:

- Profile page provides following features:
- update profile image from gallery after granting permission.
- displaying signed-in users' details
- google signout button.

DATABASE:

database is created over firestore.

There are 2 types of documents in database: AllPosts and Users.

Data are stored in the form of lists and containers.

-AllPosts and Users are stored in CONTAINERS.

1.Users:

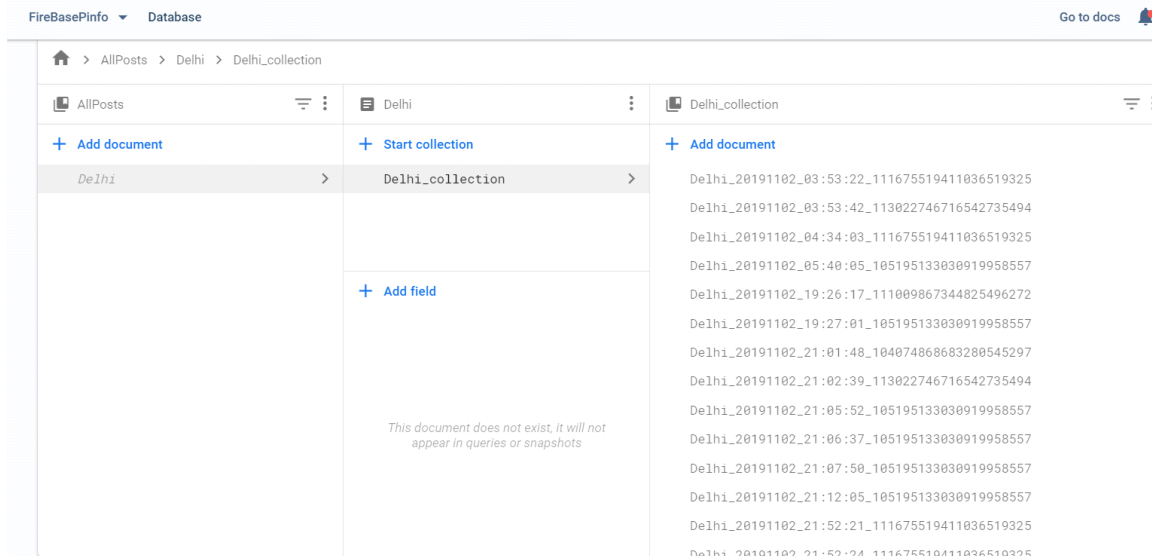

Users contain:

- firebase ID
- Username
- Email ID
- Owner ID
- Photo
- Interacted_Posts_Ref

2.AllPosts:

AllPosts contains all the details of the AllPosts. This database is subdivided into subcollections locationwise. Now all the posts which belong to a specific(same) location will be stored under same subcollections.

3. AllPosts subcollection:

Now inside a particular subcollection, the subcollection will consist of all the post from a particular location in document format. Now each document contains details of the particular posts. As shown below;
